## Multilateral Systems for Mature Assets

**For new and re-entry wells:** Baker's HOOK Hanger™ System creates TAML Level 3, 4 & 5 junctions that maximize reservoir contact, minimize surface requirements and accommodate a wide range of completion applications. Whether the field is CBM, SAGD, shallow or deep gas, Baker can help you hook into increased production at a nominal cost.

**For new wells:** The SLOPE™ System is used for TAML Level 2 junctions and delivers a reliable permanent orientation and depth reference point. This full-bore system offers maximum completion flexibility and is a simple economical solution for wells that require selective lateral access for future remedial operations.

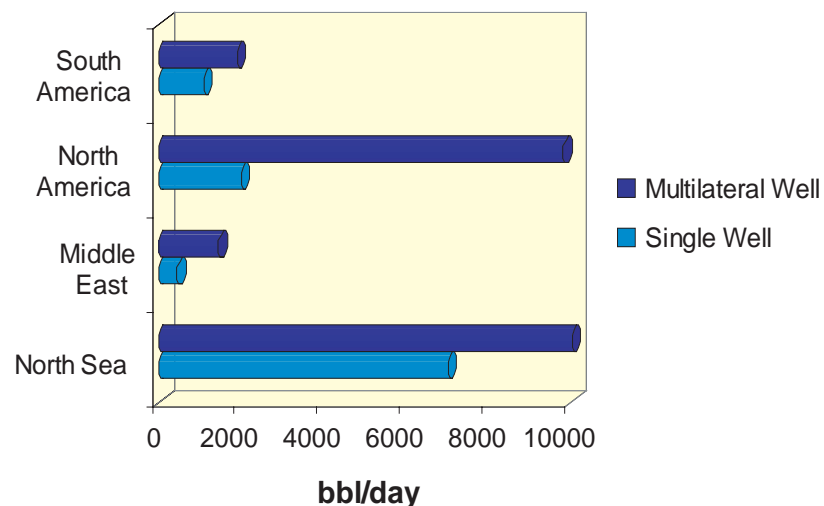

Tap into more reserves and do it economically to increase your production and return on investment using Baker Oil Tools' multilateral completions systems. Contact us today.
