

# Less water, more oil . . .

## Equalizer Uniform Inflow Control

Long horizontal wellbores increase reservoir contact. Baker's EQUALIZER™ technology creates a uniform flow profile along the entire length of the horizontal wellbore and virtually eliminates screen-to-wellbore annular flow. So, you can manage water and maximize production and reserves recovery – without worrying about screen plugging and erosion that could limit the life and profitability of your well.

More than 20,000 EQUALIZER Production Management Units are helping operators throughout the world maximize producing asset NPV. Contact us today at [www.sandcontrol.com](http://www.sandcontrol.com) to learn how EQUALIZER can benefit your bottom line.
